Subject: Gingival Flap Procedure and Apically Positioned Flap
Guideline #: 04-207
Status: Revised

Publish Date: 01/01/2024
Last Review Date: 10/11/2023

Description

This document addresses the Gingival Flap Procedure, including root planing, and Apically Positioned Flap.

The plan performs review of gingival flap procedure and apically positioned flap due to contractual requirements that necessitate benefits for dental services meet specific contract requirements. For example, plan contract(s) may require the provision of benefits for services that meet generally accepted standards of dental care at the lowest cost that properly addresses the patient's condition. The conclusion that a particular service is medically or dentally necessary and/or appropriate does not constitute an indication and/or warranty that the service requested is a covered benefit payable by the dental plan.

Clinical Indications

The gingival flap procedure or apically positioned flap is considered appropriate for the treatment of mild to severe periodontal disease when non-surgical methods such as scaling and root planing have been unsuccessful in removal of below the gum deposits of plaque (biofilm) and calculus and where, due to supra-bony pocket depths osseous recontouring and bone grafting are not required. A soft tissue flap is reflected or resected to allow debridement of the root surface and the removal of granulation tissue.

Dental review as it applies to accepted standards of care means dental services that a Dentist, exercising prudent clinical judgment, provides to a patient for the purpose of evaluating, diagnosing or treating a dental injury or disease or its symptoms, and that are: in accordance with the generally accepted standards of dental practice; in terms of type, frequency and extent and is considered effective for the patient's dental injury or disease; and is not primarily performed for the convenience of the patient or Dentist, is not cosmetic and is not more costly than an alternative service.

For dental purposes, "generally accepted standards of dental practice" means:

- standards that are based on credible scientific evidence published in peer-reviewed, dental literature generally recognized by the practicing dental community
- specialty society recommendations/criteria
- the views of recognized dentists practicing in the relevant clinical area
- any other relevant factors from credible sources

Criteria

1. Treatment of diseased gingiva after nonsurgical methods, such as root planing and scaling, have been unsuccessful in the removal subgingival of plaque and calculus. Periodontal charting, after completion of non-surgical periodontal therapy (D4341/D4342) or periodontal maintenance (D4910) is required.
2. Current (within 12 months), dated, post initial therapy periodontal charting (6 point periodontal charting) indicating pocket depth recordings of a minimum of 5mm.
3. Current (within 12 months), dated, pretreatment radiographs showing periapical area and undistorted image of the alveolar crest.
4. The procedure is indicated in the presence of supra-bony pocket depths where there is a need for increased access to root surfaces.

5. Chart notes may be requested in order to demonstrate a soft tissue flap was reflected/resected or planned, to allow debridement of the root surface and the removal of granulation tissue. Osseous recontouring is not accomplished with this procedure.
6. Gingival flap procedures will be limited to two quadrants per date of service. Exceptions will be allowed on a case by case basis.
7. Gingival flap procedures will be considered for treatment of periodontal defects involving natural teeth only. Gingival flap procedures will not be considered when the procedure is performed around implants.
8. The use of lasers is considered an adjunct to treatment and is not eligible for an additional or separate benefit.
9. Gingival flap procedure or apically positioned flap are not performed for treatment of pockets extending below the mucogingival junction.
 - a. Treatment of pockets extending below the mucogingival junction.
10. The presence of minimal amounts of attached keratinized tissue. Should multiple similar procedures be performed on the same date of service (such as, but not limited to scaling and root planing when performed with gingival flap procedures), then the less complex procedure will be considered as inclusive to the primary procedure.
11. Gingival flap procedure for exploratory purposes to determine the presence of a cracked tooth or fractured root may be benefited.

Coding

The following codes for treatments and procedures applicable to this document are included below for informational purposes. Inclusion or exclusion of a procedure, diagnosis or device code(s) does not constitute or imply member coverage or provider reimbursement policy. Please refer to the member's contract benefits in effect at the time of service to determine coverage or non-coverage of these services as it applies to an individual member.

CDT Including, but not limited to, the following:

D4240	Gingival Flap Procedure including root planing – four or more teeth
D4241	Gingival Flap Procedure including root planing – one to three teeth
D4245	Apical Positioned Flap
